

Multimodal Financial Due-Diligence Evidence Engine

Problem: ordinary RAG is unsafe for financial due diligence

Ordinary RAG can return fluent financial answers while mixing fiscal periods, units, sources, or unsupported management narratives.

This project frames due diligence as claim-level evidence verification rather than chatbot answer generation.

Multimodal Financial Due-Diligence Evidence Engine

System overview

Pipeline: claim decomposition -> retrieval -> evidence graph linking -> financial normalization -> validator gates -> auditable memo.

The local corpus covers SEC/XBRL facts, filings, transcripts, tables, raw chunks, investor-deck pages, and chart evidence fixtures.

Multimodal Financial Due-Diligence Evidence Engine

Evidence graph and validators

Evidence nodes are tied to company, period, source type, modality, metric, and provenance.

Validators check citation support, fiscal periods, entity/source consistency, numeric reconciliation, unsupported claims, contradictions, and red-team failure modes.

Real retrieval benchmark

BM25 verdict accuracy: '0.6666666666666666666666667'.

cases.

Multimodal Financial Due-Diligence Evidence Engine

Three failure case studies

- 'fiscal_period_confusion': 'period_confusion', verdict 'support'
- 'numeric_unit_mismatch': 'numeric_validation_gap', verdict 'support'
- 'unsupported_narrative_claim': 'unsupported_claim', verdict 'insufficient'

Multimodal Financial Due-Diligence Evidence Engine

Investor deck and chart extraction case

Claim: NVIDIA FY2024 Data Center revenue was \$47.5 billion.

Deck pages: '1', chart evidence: '1', reconciliation rows: '1'.

Verdict: 'support' for NVIDIA FY2024 Data Center revenue after chart-to-XBRL reconciliation.

Ablation results

- 'without_graph' verdict accuracy '1'
- 'without_numeric_validator' verdict accuracy '0.666666666666666666666666666667'
- 'without_fiscal_period_validator' verdict accuracy '1'
- 'without_chart_table_extraction' verdict accuracy '1'
- 'without_contradiction_detector' verdict accuracy '0.833333333333333333333333333333'
- 'without_reranker' verdict accuracy '1'

Multimodal Financial Due-Diligence Evidence Engine

Limitations

The raw corpus is still a deterministic local fixture, not a broad live SEC paragraph index.

Dense retrieval defaults to an offline deterministic proxy; optional real embedding

providers are skipped unless available.

The chart extraction slice is narrow and text-extractable; broad chart parsing remains future work.

Red-team detection accuracy is '0.75', not perfect by design.

Multimodal Financial Due-Diligence Evidence Engine

Reproducibility

One-command portfolio report generation: `'python3 scripts/build_portfolio_report.py'`.

Trace reproduction: `'python3 scripts/smoke_trace_reproducibility.py'`.

Full local validation remains offline and deterministic; no API key is required.

Multimodal Financial Due-Diligence Evidence Engine

Resume bullet

Built a multimodal financial due-diligence evidence engine combining SEC/FMP data, earnings transcripts, investor decks, GraphRAG, table/chart extraction, and claim-level validators to reconcile financial narratives, detect unsupported claims, numeric mismatches, fiscal-period errors, and cross-document contradictions.
